Paper : 6.1

(Spectroscopy)

Full Marks: 60

Time : Three hours

The figures in the margin indicate full marks for the questions.

The symbols, used here, signify their usual meaning.

1. Answer in brief: (any seven) 1×7=7

(a) Why cannot IR radiation induce electronic transition?

Contd.

(b) Consider the following relationships among the components of moment of inertia:

$$I_A = I_B = I_C; \quad I_A \neq I_B \neq I_C;$$

 $I_A = 0, I_B = I_C; \quad I_A \neq 0, I_B = I_C$

Which of these combinations represent CO_2 molecule?

(c) Which of the following molecules will be simultaneously IR and microwave active?

Cl₂, OCS, CO₂, CH₄, HBr

(d) State True or False :

As the vibrational quantum number increases, the spacing between two adjacent vibrational levels of a diatomic molecule decreases.

- (e) In the Raman effect, the transfer of energy between the photon and the molecule lies in the range 3 to 3000 cm⁻¹. What types of transitions the molecule may undergo due to this energy transfer?
- (f) State the rule of mutual exclusion in connection with Raman spectroscopy.

- (g) State in which of the following compounds will the protons show resonance at the highest downfield: CH_2Cl_2 , CH_3F , CH_3I
 - (h) Name the transitions which are responsible for the coarse and the fine structures of the electronic spectrum.
- 2. Answer the following questions: 2×4=8
 - (a) For the transition from the energy level A to the energy level C of a quantum mechanical system a radiation with wavelength 450 nm is absorbed. Again transition from level B to level C of the same system requires a radiation of wavelength 850 nm. Find the wavelength of the radiation required for the transition from the level A to the level B.
 - (b) Considering a diatomic molecule to be rigid rotator, write in brief how the presence of heavier isotope affects the rotational spectrum.
 - (c) The Stokes' lines are more intense than the anti-Stokes' lines. Explain.

3 (Sem-6) CHM M1/G 3 A O\IM MHO (Contd.

3 (Sem-6) CHM M1/G 2

(d) The IR spectra of ethanol are taken under the following two conditions:

(i) 10% (V/V) in CCl_4 and

one do(ii) 1% (V/V) in CCl_4 .

Discuss what difference you may observe in the two spectra.

Answer the following questions: 2×4=8

What do you mean by characteristic group frequencies in IR spectroscopy? Explain with example.

3. (a) Answer either [(i) and (ii)] or [(iii) and (iv)]:

transition from level B to level C of the same system requires a radiation of

 (i) Define transition moment. What do you mean by allowed and forbidden transitions in the context of transition moment?

(ii) The lifetime of an excited electronic state is 10^{-8} s. Calculate the width of the spectral line in Hz. 2

3 (Sem-6) CHM M1/G 4 8 0 M MH2 (a mail to

(iii) Discuss how the component of dipole moment along a particular direction varies with time in anti-symmetric stretching vibration of CO_2 .

(iv) A monochromatic radiation is allowed to pass through a solution of a compound with concentration $10 \text{ mol } m^{-3}$ when the intensity of

the radiation reduces to $\frac{1}{10}$ th of the initial value. Calculate molar extinction coefficient. 2

(b) Considering diatomic molecule to be anharmonic oscillator, deduce expressions for energy needed for the allowed vibrational transitions. Explain fundamental absorption and overtones.

(c) Answer either [(i) and (ii)] or [(iii)]:

5

with the electronic transitions in

(i) What do you mean by symmetric and antisymmetric vibrations? What are perpendicular and parallel vibrations? Discuss taking the example of H_2O . 3

3 (Sem-6) CHM M1/G

O Contd.

5

(ii) Using a monochromatic radiation of wavelength 435.8 nm the Raman spectrum of $C_2H_2(g)$ is observed. The spectrum shows one of the lines at 511 nm. Determine the wavenumber of the vibrational band corresponding to this observation. 2

of a comprond with concentration

(iii) The spacing between the consecutive S-branch lines in the relow state pure rotational Raman spectrum of H₂ is 243.2 cm⁻¹. Calculate bond length of H₂. 5

4. Answer either [(a), (b) and (c)] or [(d), (e) and (f)]: allowed vibrational transitions. Explain

(a) Write the selection rules associated with the electronic transitions in atom. Hence, explain the fine structure of the spectra of H-atom. 1 or [(iii)] : 5

(b) A radiation of frequency 5.14×10^{15} Hz ejects a photoelectron from Ar. The kinetic energy of the photoelectron is 5.4 eV. Calculate 3 binding energy.

6

3 (Sem-6) CHM M1/G

The $\pi \to \pi^*$ transition in ethene is observed at 170 nm with molar extinction coefficient of $1000 m^2 mol^{-1}$. Will these values vary markely in (i) 1,3-butadiene, and (ii) 1,5-hexadiene? Explain with reason. 2

() Using Woodward-Fieser rules

(d) Electronic transition is accompanied by vibrational transitions. Discuss with diagram how the vibrational bonds in the electronic spectrum of a diatomic molecule will appear, if -

(i) the internuclear distance in the ground and the excited of a proton are electronic stages is same, and

field. In presence of magnetic field, B., (ii) internuclear distance in the excited state is considerably greater than that in the ground state which may lead ed yam state to dissociation of the molecule. 5

3 (Sem-6) CHM M1/G 7 OCM MHO Contd.

(e) Define chromophore and auxochrome. What do you mean by blue shift of λ_{max} value? The $\pi \rightarrow \pi^*$ transition in aniline is observed at 230 nm. State how this mislovel so value will change in anilinium ion. 3

(f) Using Woodward-Fieser rules predict the λ_{max} value of $\pi \to \pi^*$ transition in — 2 eque meraccompanied shy vibrational

5. Answer either [(a), (b) and (c)] or [(d), (e) and (f)]:

actronic spectrum of a diatomic

manaib dim seusa Cieneram

bonds in the

(a) The two spin states of a proton are degenerated in absence of magnetic field. In presence of magnetic field, Bz, in the z-direction this degeneracy is lifted. Deduce an expression for the energy difference between the two spin stages. Write how transition from the lower to the higher spin state may be induced. 3+2=5

3 (Sem-6) CHM M1/G 8

- (b) Why is tetramethylsilane used as reference in NMR spectroscopy? 3
- Calculate the frequency of the radiation (c) required by an electron to undergo transition from the lower spin state to the higher spin state when a magnetic field of strength 0.34T is used.

Given $\beta = 9.273 \times 10^{-24} JT^{-1}$ and g = 2.

(b) What do your o can by McLafferty

- (d) What do you mean by hyperfine structure of ESR signals? Discuss about the hyperfine structure of the ESR spectrum of deuterium. 1+3=4
- (e) Write in brief about diamagnetic shielding in ${}^{1}H$ NMR spectroscopy. 2
- (f)State how many ${}^{1}H$ NMR signals will be shown by

(d) In mass ${}_{H}$ trometry generally 70 eV electrons ${}_{1}^{e}$ used when an organic $CH_3 - CH_2 - CH_2 - C = CH_2$

> Identify the protons which will show resonance at the highest downfield. Predict the splitting of signals due to spin-spin coupling.

3 (Sem-6) CHM M1/G 90 Contd.

6. Answer either [(a), (b) and (c)] or [(d), (e) and (f)]:

 (a) Draw a schematic labelled diagram of the mass spectrometer. What do you mean by electron ionization process? Discuss the fragmentation pattern of methanol. Identify the species responsible for the base peak.

1+3+1=5

(b) What do you mean by McLafferty rearrangement? Explain taking the example of pentanal. 3

(c) Write how the molecular mass of an organic compound can be determined by varying the energy of the bombarding electron in mass spectrometry.

be shown by TO

 (d) In mass spectrometry generally 70 eV electrons are used when an organic compound undergoes fragmentation. Explain how the different ions are

detected according to their $\frac{m}{z}$ values by varying the accelerating potential.

3 (Sem-6) CHM M1/G 10? - O\IM MHO (d-ms2) 8

- (e) Show the fragmentation of 2-methylbutane in electron ionization process. Identify the peaks with higher intensities.
 3+1=4
- (f) Write how a mass spectrum is presented. Distinguish between molecular ion peak and base peak.

- (d) Calculate the residual entropy of one mole of CO at 298K. Discuss accuracy and precision with examples. 2+2=4
- (e) Calculate the translational partition function of H_2 molecule confined to a 1000 cm³ vessel at 25°C. 3
- (f) Calculate the internal energy of 1 mole of He at 25°C.

Paper: 6.2

(Physical Chemistry)

Full Marks: 60

Time : Three hours

The figures in the margin indicate full marks for the questions.

1. Answer the following in brief: $1 \times 7 = 7$

- (a) A substance $A_x B_y$ crystallizes in an fcc lattice in which atoms A occupy each corner of the cube and atoms B occupy the centres of each face of the cube. What will be the correct formula of the substance?
- (b) A group 13 element is added in small amounts to Ge crystal. The doped crystal acts as _____ semiconductor. (Fill up the gap)

Contd.

- (c) What is the unit of flocculation value of a coagulating electrolyte?
 - (d) What happens when a freshly precipitated $Fe(OH)_3$ is shaken with little amount of dilute solution of $FeCl_3$? Give reaction.
 - (e) The weight average molecular weight of a polymer is 29,000. If the polydispersity index of the polymer is 0.7, what will be its number average molecular weight?
 - (f) If Z is the partition function and
 - $\beta = \frac{1}{k_B T}$, what will be the average

energy of the system?

(g) The formation of micelles takes place above a particular temperature called _____. (Fill up the gap)

2

- 2. Answer the following questions : $2 \times 4 = 8$
 - (a) Match crystal system/unit cells mentioned in Column I with their characteristics features mentioned in Column II:

Column I		Column II	
(A)	Simple cubic and face centred cubic	(p)	have the cell parameters $a=b=c$ and $\alpha = \beta = \gamma$.
(B)	Cubic and rhombohedral	(9)	are two crystal systems.
(C)	Cubic and tetragonal	(r)	have only two crystallographic angles of 90°.
(D)	Hexagonal and monoclinic	(s)	belong to same crystal system.

- (b) On passing H_2S through an aqueous solution of SO_2 , a yellow turbidity is formed. Why?
- (c) Distinguish between error and uncertainty with examples.
- (d) Give the physical significance of molecular partition function.

3 (Sem-6) CHM M 2/G 3

O S M MH Contd.

3 (Sem-6) CHM M 2/G

3. (a) What are Schottky defects? Derive an expression for the number of Schottky defects in a crystal. 2+3=5

0

State Bragg's law and deduce the equation

$2d\sin\theta = n\lambda$

The diffraction of barium with X-radiation of wavelength 2.29Å gives a first order reflection at 30°. What will be the distance between the diffracted planes? 3+2=5

 (b) Using partition function, deduce an expression for the entropy of monatomic gas.

noungles of 90°

Using the concept of partition function, deduce an expression for the internal energy of monoatomic ideal gas. Hence find an expression for the heat capacity at constant volume. 3+2=5

(c) Write briefly about the various types of errors in measurement. An experiment was conducted to determine the amount of calcium present in dolomite. The result was found to be 21.85% while the true value is 21.73%. Find the relative error. 3+2=5

4 8

4. Answer either (a), (b) and (c) or (d), (e) and (f):

- (a) Explain the origin of low temperature super conduction in terms of Cooper pair.
- (b) The first order reflection of a beam of X-rays from 100 planes of NaCl occurs at an angle of 6°30'. Calculate the wavelength of the X-ray. What would be the angle of reflection if X-rays of $\lambda = 1.54$ Å were used.
- (c) What is radius ratio ? How does radius ratio help in determining the structure of ionic solids and co-ordination number of ions ? Explain.
- (d) An element crystallizes in a body centered cubic structure with a cell edge of 288 pm. The density of the element is 7.2 gcm⁻³. How many atoms are present in 208 g of the element?
- (e) How does electrical conductivity of metals and semi-conductors vary with temperature?
 3

S M MHO IA

- (f) Why does *LiCl* acquire pink colour when heated in *Li* vapour? 3
- 5. Answer **either** (a), (b) and (c) **or** (d), (e) and (f):
 - (a) Discuss the light scattering method for determination of the molar mass of polymer.
 - (b) A protein sample has 35% haemoglobin
 - $(M = 15.5 kgmol^{-1})$, 35% myoglobin
 - $(M = 17.2 \, kg \, mol^{-1})$ and 30% ribonuclease
 - $(M = 13.7 kgmol^{-1})$. Calculate the numberaverage and mass-average mass of the protein. 3
 - (c) Discuss the origin of charge on colloidal particles in detail. 3
 - (d) What are super conductors ? Define low and high temperature super conductors with suitable examples. 1+3=4
 - (e) Discuss the kinetics of condensation polymerization. 3

6

- (f) In a polymer sample 25% molecules have molar mass 15,000, 40% have molar mass 20,000 and the rest have molar mass 25,000. Calculate weight average and number average molar mass of the polymer.
- 6. Answer either (a), (b) and (c) or (d), (e) and (f):
 - (a) For a diatomic molecule vibrating as a simple harmonic oscillator, obtain an expression for vibrational partition function.
 - (b) The frequency of absorption band for CO associated with its vibrational transition is 6.51×10^{13} per second.
 - (i) At what temperature does kT become equal to the energy of the vibrational transition?
 - (ii) Calculate the fraction of CO molecules in the vibrational level v=1 at 27°C. 2+2=4
 - (c) Write the expression for Boltzmann distribution. Mention the meaning of the terms involved. Gives its physical significance.

The figures in the margin indicate full marks for the questions.

- 1. Answer the following questions: $1 \times 7 = 7$
 - (a) What is atactic polymer?
 - (b) State the Einstein's law of photochemical equivalence.
 - (c) What is protein?

Contd.

What is the structural unit otterratoara present in sulfa drugs ? Explain

(ii) Explain with examples, how nucleosides and nucleotides differ.

VOCC / D/CMMHO

- (d) What are ribozymes?
- (e) Write the name of a zinc-containing metalloenzyme.
 - (f) What is Wigner spin conservation rule?
 - (g) What is Special isoprene rule?
- 2. Answer any four of the following: 2×4=8
 - (a) How is phosphorescence different from fluorescence ?
 - (b) What are elastomers? Name a synthetic elastomer and give its structure.
 - (c) Give the names and structures of the sugar components present in RNA and DNA.
- 3 (Sem-6) CHM M 3/G 2

- (d) What are essential and non-essential amino acids? Give one example of each.
 (e) D-fructose is a ketohexose, yet it reduces Fehling's solution. Explain.
- (f) Give an example each of narrowspectrum and broad-spectrum antibiotics.
- 3. Answer any three of the following:

Answer (a) or (b), (c) or (d) and (e) or (f);

- (a) Discuss photochemical cis-trans isomerisation. What is photostationary state?
 (b) Why benzophenone acts as a good photosensitizer? Explain with an
- example, the process of photosensitisation of organic compounds. 2+3=5
